convert_custom

Convert Identifiers with Custom Database

Description

Convert Identifiers with Custom Database

Usage

convert_custom(x, from = NULL, to = NULL, dt = NULL, multiple = FALSE)

Arguments

x
from
to
dt
multiple

A character vector to convert.
Which identifier type to be converted.
Identifier type convert to.
A data.frame as database for conversion.
if TRUE, return a data.table instead of a string vector, so multiple identifier mappings can be kept.

Value

A character vector.

Examples

dt <- data.table::data.table(UpperCase = LETTERS[1:5], LowerCase = letters[1:5])
dt
x <- convert_custom(c("B", "C", "E", "E", "FF"), from = "UpperCase", to = "LowerCase", dt = dt)
x
convert_hm_genes

**Description**

Convert Human/Mouse Gene IDs between Ensembl and Hugo Symbol System

**Usage**

```r
close_hm_genes(
    IDs,
    type = c("ensembl", "symbol"),
    genome_build = c("hg38", "hg19", "mm10", "mm9"),
    multiple = FALSE
)
```

**Arguments**

- **IDs**
  a character vector to convert.
- **type**
  type of input IDs, could be 'ensembl' or 'symbol'.
- **genome_build**
  reference genome build.
- **multiple**
  if TRUE, return a data.table instead of a string vector, so multiple identifier mappings can be kept.

**Value**

a vector or a data.table.

**Examples**

```r
close_hm_genes("ENSG00000243485")
close_hm_genes("ENSG00000243485", multiple = TRUE)
close_hm_genes(c("TP53", "KRAS", "EGFR", "MYC"), type = "symbol")
```
convert_icgc Convert ICGC Identifiers

Description

Run data("icgc") to see detail database for conversion.

Usage

convert_icgc(
  x,
  from = "icgc_specimen_id",
  to = "icgc_donor_id",
  multiple = FALSE
)

Arguments

x A character vector to convert.
from Which identifier type to be converted. One of .
to Identifier type convert to. Same as parameter from.
multiple if TRUE, return a data.table instead of a string vector, so multiple identifier mappings can be kept.

Value

A character vector.

Examples

x <- convert_icgc("SP29019")
x

## Not run:
convert_icgc("SA170678")

## End(Not run)
**convert_pcawg**

Convert PCAWG Identifiers

**Description**

Run `data("pcawg_full")` or `data("pcawg_simple")` to see detail database for conversion. The `pcawg_simple` database only contains PCAWG white-list donors.

**Usage**

```r
convert_pcawg(
  x,
  from = "icgc_specimen_id",
  to = "icgc_donor_id",
  db = c("full", "simple"),
  multiple = FALSE
)
```

**Arguments**

- `x`: A character vector to convert.
- `from`: Which identifier type to be converted. For `db "full"`, one of . For `db "simple"`, one of .
- `to`: Identifier type convert to. Same as parameter `from`.
- `db`: Database, one of "full" (for `data("pcawg_full")`) or "simple" (for `data("pcawg_simple")`).
- `multiple`: if `TRUE`, return a data.table instead of a string vector, so multiple identifier mappings can be kept.

**Value**

A character vector.

**Examples**

```r
x <- convert_pcawg("SP1677")
x

y <- convert_pcawg("D0804",
  from = "icgc_donor_id",
  to = "icgc_specimen_id", multiple = TRUE
)
y
# Not run:
convert_pcawg("SA5213")

# End(Not run)
```
convert_tcga  
*Convert TCGA Identifiers*

**Description**

Run `data("tcga")` to see detail database for conversion.

**Usage**

`convert_tcga(x, from = "sample_id", to = "submitter_id", multiple = FALSE)`

**Arguments**

- **x**: A character vector to convert.
- **from**: Which identifier type to be converted. One of .
- **to**: Identifier type convert to. Same as parameter `from`.
- **multiple**: if TRUE, return a `data.table` instead of a string vector, so multiple identifier mappings can be kept.

**Value**

A character vector.

**Examples**

```r
x <- convert_tcga("TCGA-02-0001-10")
x
```

```
## Not run:
convert_tcga("TCGA-02-0001-10A-01W-0188-10")
```

```
## End(Not run)
```

filter_tcga_barcodes  
*Filter TCGA Replicate Sample Barcodes*

**Description**

Check details for filter rules.
Usage

```r
filter_tcga_barcodes(
  tsb,
  analyte_target = c("DNA", "RNA"),
  decreasing = TRUE,
  analyte_position = 20,
  plate = c(22, 25),
  portion = c(18, 19),
  filter_FFPE = FALSE
)
```

Arguments

tsb a vector of TCGA sample barcodes.
analyte_target type of barcodes, "DNA" or "RNA".
decreasing if TRUE (default), use decreasing order to select barcode to keep.
analyte_position bit position for analyte. DON’T CHANGE IT if you don’t understand.
plate bit position for plate. DON’T CHANGE IT if you don’t understand.
portion bit position for portion. DON’T CHANGE IT if you don’t understand.
filter_FFPE if TRUE (FALSE is default), filter out FFPE samples.

Details

In many instances there is more than one aliquot for a given combination of individual, platform, and data type. However, only one aliquot may be ingested into Firehose. Therefore, a set of precedence rules are applied to select the most scientifically advantageous one among them. Two filters are applied to achieve this aim: an Analyte Replicate Filter and a Sort Replicate Filter.

**Analyte Replicate Filter:**
The following precedence rules are applied when the aliquots have differing analytes. For RNA aliquots, T analytes are dropped in preference to H and R analytes, since T is the inferior extraction protocol. If H and R are encountered, H is the chosen analyte. This is somewhat arbitrary and subject to change, since it is not clear at present whether H or R is the better protocol. If there are multiple aliquots associated with the chosen RNA analyte, the aliquot with the later plate number is chosen. For DNA aliquots, D analytes (native DNA) are preferred over G, W, or X (whole-genome amplified) analytes, unless the G, W, or X analyte sample has a higher plate number.

**Sort Replicate Filter:**
The following precedence rules are applied when the analyte filter still produces more than one sample. The sort filter chooses the aliquot with the highest lexicographical sort value, to ensure that the barcode with the highest portion and/or plate number is selected when all other barcode fields are identical.

**NOTE:** Basically, user provides tsb and analyte_target is fine.

Value

a barcode list.

  filter_FFPE = TRUE
)
```

---

icgc | ICGC Sample Identifiers
---

**Description**

ICGC Sample Identifiers

**Format**

A data frame with 155874 rows and 6 variables.

**Source**

https://dcc.icgc.org/repositories

**Examples**

```r
load_data("icgc")
```
load_data

**Load Data from Local or Remote Zenodo Repository**

**Description**

Data are stored in remote Zenodo repo. This function will help download required data and load it into R.

**Usage**

```r
load_data(x)
```

**Arguments**

- `x` a dataset name.

**Value**

typically a `data.frame`, depends on `x`.

**Examples**

```r
load_data("pcawg_full")
load_data("pcawg_simple")
load_data("tcga")
load_data("icgc")
```

---

ls_annotables

**List Annotation Tables from annotables package**

**Description**

The tables are obtained from annotables package and stored in Zenodo for better management. They can be downloaded and loaded with `load_data()`. See details for more info.

**Usage**

```r
ls_annotables()
```
Details

Many bioinformatics tasks require converting gene identifiers from one convention to another, or annotating gene identifiers with gene symbol, description, position, etc. Sure, *biomaRt* does this for you, but users may get tired of remembering *biomaRt* syntax and hammering Ensembl’s servers every time. These tables have basic annotation information from *Ensembl Genes* for:

- Human build 38 (grch38)
- Human build 37 (grch37)
- Mouse (grcm38)
- Rat (rnor6)
- Chicken (galgal5)
- Worm (wbcel235)
- Fly (bdgp6)
- Macaque (mmul801) Where each table contains:
  - `ensgene`: Ensembl gene ID
  - `entrez`: Entrez gene ID
  - `symbol`: Gene symbol
  - `chr`: Chromosome
  - `start`: Start
  - `end`: End
  - `strand`: Strand
  - `biotype`: Protein coding, pseudogene, mitochondrial tRNA, etc.
  - `description`: Full gene name/description

Additionally, there are `tx2gene` tables that link Ensembl gene IDs to Ensembl transcript IDs.

**NOTE**, the description above is copied from README of `annotables` package. If you are unclear to the data tables, please refer to `annotables`.

Value

A `data.frame`

References

https://github.com/stephenturner/annotables

Examples

```r
ls_annotables()
load_data(ls_annotables()[1])
```
parse_gdc_file_uuid  Parse Sample ID from GDC Portal File UUID

Description
Parse Sample ID from GDC Portal File UUID

Usage
parse_gdc_file_uuid(
  x,
  legacy = FALSE,
  fields = c("cases.samples.submitter_id", "cases.samples.sample_type", "file_id"),
  token = NULL,
  max_try = 5L
)

Arguments
x  a GDC manifest file or a vector of file UUIDs.
legacy  if use GDC legacy data.
fields  a list of fields to query. If it is a string, then fields should be separated by comma. It could also be a vector. See https://docs.gdc.cancer.gov/API/Users_Guide/Appendix_A_Available_Fields/#file-fields for list.
token  the token used for querying.
max_try  maximum try time.

Value
a data.frame

Examples
parse_gdc_file_uuid("fe522fc8-e690-49b9-b3b6-fa3658705057")
parse_gdc_file_uuid(
  c(
    "fe522fc8-e690-49b9-b3b6-fa3658705057",
    "2c16506f-1110-4d60-81e3-a85233c79909"
  )
)
### pcawg_full

**PCAWG Full Sample Identifiers**

**Description**

PCAWG Full Sample Identifiers

**Format**

A data frame with 7255 rows and 8 variables.

**Source**

https://dcc.icgc.org/releases/PCAWG

**Examples**

load_data("pcawg_full")

---

### pcawg_simple

**PCAWG Mutation Related Simplified Sample Identifiers**

**Description**

This dataset contains less records than data("pcawg_full") but with more ID columns. Of note, only white-list donors included.

**Format**

A data frame with 2583 rows and 12 variables.

**Source**

https://www.nature.com/articles/s41586-020-1969-6

**Examples**

load_data("pcawg_simple")
Description

How to get the dataset can be viewed in code under data-raw. Cases in case_id column can be directly mapped to a GDC portal page, e.g. https://portal.gdc.cancer.gov/cases/30a1fe5e-5b12-472c-aa86-c2db8167ab23.

Format

A data frame with 150849 rows and 5 variables.

Source

https://portal.gdc.cancer.gov/

Examples

load_data("tcga")
